			Page Titles (2)	Description Meta Tag (5)	Heading Tags (5)	Navigation (5)	URLs (1)	Links (1)	Images (5)	Code neatness (10)			
			Unique and descriptive, but not too long	Is it used correctly and give a summary of what the page is about?	Have they used the best practices for headings: used it to break up data and emphasiss heirarchy in the copy?	Does the website have clear and ealy to use navigation page? Is the navigation hieracial?	Appropriate names of URLs	Are links appropriate and have they used text/icons in a well structured way?	Are the images optimised properly and have they included the use of alt tags	Is the code neatly indented, commented and structured. Have unnecessary repitons in code been removed.

Dineo presents very well and professionally - keep up the good work!			The index's title page's text needs to have spaces between the words and also be a little bit more descriptive for the index.html	There is no description meta tag in the index.html or the othernews.html pages	How you have used the h1 tag is good and makes hierarchal sense. You've used an h4 tag for the subheading, but you should swap this for an h2 tag so that it makes more sense in terms of hierarchy. It also seems like your h4 tags are a bit bigger than your h3 tags.	It is relatively easy to navigate your website and understand where you are on the page. I think the back button at the bottom of the articles is a good way for the user to go through the website. I think it's good that you have categorized your navbar's items in a logical way. The nav bar itself needs a lot of work in how it presents itself to the user.	URL names make sense for the pages that Dineo worked on.	Links are appropriately named and, where appropriate, you have used icons. Please make sure that you make article titles and their images links to the article itself.	All images are optimized on the home page. The alt tags need to have a lot more detail in them - they need to describe the image in a few words.	Code is overall quite neat but there needs to be a lot more commenting throughout all of your files. Particularly inside of the JS, we need to see that you understand how the code works.	Filing structure is good, but I think the images need to be put into additional folders so that they are seperated according to each page (for example, an image fodlier called 'good life' where all the good life images are stored etc.). Please be sure to rename the Adobe stock images to something that is relevant to your website. Please make sure to be consistent with cammel casing whenever you name files or folders within your project folder structure.
